PRODUCT DESCRIPTION

The NS range of speaker stands is Solidsteel's basic series, designed for a large number of bookshelf loudspeakers, ideal for any kind of space and room. The NS series is also perfect for supporting centre speakers or satellite speakers in home theatres.

Each stand is made of 5 steel pipes finely painted in black, screwed between a wooden (and painted) top plate of 160x160 mm and a heavy steel bottom-plate, crafted by laser cut. The bottom metal cones are threaded to support our traditional height-adjustable, stainless steel spikes. All steel pipes are filled by

Stratocell®, which is a semi-rigid sound-absorbing polyethylene foam sheet that with its innovative closed cell structure revolutionizes the concept of acoustic correction. This material is highly performing (the highest classification of sound absorption - up to Class A) and it's perfect for dampening all the vibrations that could be generated on the stands.

The NS-6 speaker stands have a total height of 625mm and are very easy to assemble. Inside the package are all the required screws and Allen-Key for installation. The NS stands are also supplied with "Pata-fix®" to properly fix the speakers to the top plate.
